

(a) Global route from A* over the coastline

(b) Simulated tracks in the traffic corridor

(c) Collision and arrival rate

Direct vs A* x Comm OFF / ON
all 320 pairs · blocked 148 pairs

pending re-evaluation

Panels (a) and (b) are the existing Fig8 composition; the callout in (a) marks the corridor whose tracks are shown in (b). (a) is a coastline occupancy map built from Natural Earth polygons, not an AIS traffic digital twin. Panel (c) awaits the rerun specified in the reorganization plan: proposed checkpoint (qd_MOE_SE), ring = 0.7, direct vs A*, communication OFF vs ON, reporting all 320 spawn-goal pairs and the 148 blocked pairs separately (172 / 320 already have a clear direct line). The corridor tracks in (b) come from checkpoint ql_SE_START_s42, not the proposed qd_MOE_SE. This is zero-shot waypoint integration: the policy was trained on direct goals, not retrained for waypoints.
